Exercise 3: Python: virtual environments and exceptions

In this exercise you will practice Git, creating virtual environments and Exceptions. For this exercise divide yourself in groups of 2-3 students (same or different from previous homework). Each component of the group should do at least one commit or be penalized otherwise. The group should do at least one Pull Request or be penalized otherwise.

1. Create a new virtual environment for this project.
2. Create a repository in the account of one of the components of the group.
3. Clone the repository locally each of the components of the group.
4. Complete the exercises in hw3.py file and commit the solutions.
5. Share the link to the repository through Classroom by delivering the assignment and let my user (Icedgarr) have access to it. (If you created a public repository you won't need to do anything to grant me access, if you created a private repository you should invite my user)

Some picks from the **Zen of Python**

Explicit is better than implicit.

Readability counts.

Errors should never pass silently.

Unless explicitly silenced.
